

Yii² What's new?

Alexander Makarov,
Yii core team

Some statistics

Who uses Yii?

Why?

1. Well-balanced
2. Stable
3. Flexible
4. Well-documented

2011 — beginning of 2012 events

What happened?

- 5 stable Yii 1.1 releases
- Yii 1.1 Application Development Cookbook
- Yii for Eclipse PDT, CodeLobster
- Yii → GitHub
- Events:
 - Yii beer party
 - YiiTalk
 - YiiConf

GoogleTM
code

github
SOCIAL CODING

First two days

- 348 watches
- 61 forks

Now

- 1134 watches
- 240 forks

Yii 1.1.11 will be quite interesting
release ;)

What's bad in Yii 1.1?

- AR (finder and record are the same object, some API).
- Some classes are in strange places.
- More small things.

The biggest issue is **BC**

Prado, from 2004 → Yii 1.0, 2008 → Yii 1.1, 2010

Yii 2 team

- 3 active core developers: qiang, samdark, mdomba.
- github.

- PHP 5.3.8+
- All classes are
namespaced (\yii) and
w/o prefix
- PSR-0
- Better structure
- Less entities
- Keep good ideas

v2

Documentation

- Larry Ullman**, author of 22 excellent IT-books and a great article series about Yii will write a book about Yii2 + will participate in official documentation writing.
- API docs will be at least same quality as 1.1.
- Code style guide.**
- There's a plan to release documentation tool to the public.

Yii2: base

- Aliases in form of `@yii/base/Component`
- `CComponent` → `Object + Component`
- SPL replaced most of collections
- Removed `CFormModel`. Now you can use `Model` directly.

```
class MyComponent extends
\yii\base\Object
{
    public $x;
    public function __construct($a, $b)
    {
        //...
    }
}

$component = MyComponent::newInstance(
    array('x'=>10),
    'a', 'b'
);
```

Yii2: View Object

- render(), widget(), beginCache() → viewObject
- In a View: \$owner = class that uses view
- \$this = View.
- No need for renderer.
- Can be used in console applications.
- CHtml is still there.

Yii2: events

```
$post->on('add',  
function($event) { ...  
});
```

```
$post->trigger('add',  
new Event($this));
```

```
$post->off('add',  
$callback);
```

```
$handlers = $post->  
getEventHandlers('add'  
);
```

- No need to explicitly declare before raising
- jQuery-like syntax
- Behaviors instead of filters

Yii2: Query object

```
// Query object
$query = new Query;
$query->select('id')->from('tbl_customer')->limit(10);
$command = $db->createCommand($query);
$this->assertEquals("SELECT `id` FROM `tbl_customer`
LIMIT 10", $command->sql);

// array
$command = $db->createCommand(array(
    'select' => 'name',
    'from' => 'tbl_customer',
));
```

Yii2: AR

```
$customer = Customer::find(2)
    ->active()
    ->one();
$customer->name = 'Qiang';
$customer->save();

$customers = Customer::find()
    ->order('id')
    ->asArray(true)
    ->all();
```

- Finder / Model
- Can create your own finder
- ~~::model()~~
- Auto quoting.
- Method chains.

Yii2: AR

```
$postFinder = Post::find()
    ->where(array(
        'active' => true
    ));
if($isPrivate) {
    $postFinder->addWhere(array(
        'createdBy' => $userId,
    ));
}
$posts = $postFinder
    ->mergeWith($anotherFinder)
    ->all();
```

~~Criteria~~

- Can merge two finders
- Can add conditions on the fly

Yii2: AR

- tableName(), relations(), scopes() = static.
- Relations are HAS_ONE, HAS_MANY.
- link = FKs
- via = through
- Anonymous functions for scopes.
- "@" and "?" tokens: own table, external table.

```
class Customer extends ActiveRecord {
    const STATUS_ACTIVE = 1;

    public static function tableName() {
        return 'tbl_customer';
    }

    public static function relations() {
        return array(
            'orders:Order[]' => array(
                'link' => array('customer_id'
=> 'id'),
            ),
        );
    }

    public static function scopes() {
        return array(
            'active' => function($q) {
                return $q-
>andWhere('@.`status` = ' . self::STATUS_ACTIVE);
            },
        );
    }
}
```

Yii2: AR

```
$customers =  
Customer::find()->  
asArray()->all();
```

```
foreach (Customer::find()  
as $customer)
```

```
$count = Customer::count()  
->value();
```

```
$customers =  
Customer::find()->active()  
->all();
```

```
$customers =  
Customer::find()  
->where('name like :name',  
array(  
    ':name' => '%customer%'  
))->order('id')->all();
```

TODO (if there will be enough time)

- HTTP (CURL) wrapper
- Package manager
- Mailer
- Twitter Bootstrap
- Debug toolbar
- Console requirements
- More helpers
- jQueryUI-based widgets
- Commercial support

1 or 2?

Don't wait. Work with stable one.

When?

Before alpha code will be put into public github repository we need to finish at least these things →

- Base for caching
- Base for i18n
- Controller + webapp
- Base for widgets
- URL manager
